COUNTER APP — TALLY & CLICKER · PRINTABLE SHEET

Estimate vs Actual Material & Waste

Close out a job and learn the real waste factor

HOW TO USE

1. Copy each material, unit, net quantity from the takeoff and the waste % you allowed.
2. At close-out, write delivered, installed (net quantity actually used) and left over (returnable or reusable stock).
3. Waste = delivered − installed − left over. Actual waste % = waste ÷ installed × 100. Use it on the next estimate.

Job / address _____ Estimator _____

Start – finish _____ Counted by _____

Material	Unit	Net takeoff qty	Waste % allowed	Ordered qty	Delivered	Installed	Left over	Waste qty	Actual waste %	Note (cause, offcuts reused)

A partial sheet or offcut is waste unless the crew reuses it on purpose; write reused offcuts in Note so the next estimate is fair.
